Canadian Data Report of Fisheries and Aquatic Sciences No. 402

Canadian Data Report of Fisheries and Aquatic Sciences

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

The correct citation appears above the abstract of each report.

Rapport statistique canadien des sciences halieutiques et aquatiques

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

Le titre exact paraît au haut du résumé de chaque rapport.

ABSTRACT

Irwin, B., C. Caverhill, D.V. Subba Rao, C. Carver and T. Platt. 1983. Primary productivity measurements in the chlorophyll maximum in the vicinity of the Mid-Atlantic Ridge, west of the Azores, from 8 July to 25 July, 1982. Can. Data Rept. Fish. Aquat. Sci. No. 402: 84 p.

During the period 8 July to 25 July 1982 a series of primary productivity experiments and related nutrient measurements were made on CSS Hudson in the vicinity of the Mid-Atlantic ridge, west of the Azores. In this report we make available the raw data and the fitted light saturation parameters.

RÉSUMÉ

Irwin, B., C. Caverhill, D.V. Subba Rao, C. Carver and T. Platt. 1983. Primary productivity measurements in the chlorophyll maximum in the vicinity of the Mid-Atlantic Ridge, west of the Azores, from 8 July to 25 July, 1982. Can. Data Rept. Rish. Aquat. Sci. No. 402: 84 p.

Durant la période du 8 Juillet au 25 Juillet des séries d'expériences sur la determination de la production primaire et des sels nutritifs furent réalisées au bord du CSS Hudson du côte de la crête au milleau de l'atlantique à l'ouest des Azores. Nous presentons dans ce rapport les donneés brutes sur ces expériences, ainsi que les paramètres qui furent calculeés pour representer les courbes de production en fonction de la lumiere.

INTRODUCTION

This is the second in a series of data reports presenting the results of photosynthesis experiments on natural phytoplankton populations in the oligotrophic subtropical waters of the North Atlantic. In this study water samples were collected from CSS Hudson in the vicinity of the mid Atlantic ridge, west of the Azores. This was a joint effort between the Biological Oceanography Division of the Marine Ecology Laboratory, the Metrology Division of Atlantic Oceanographic Laboratory and Dalhousie University.

Sampling

The majority of water samples were collected from the chlorophyll maximum. This was located by in vivo fluorescence using a submersible pump and a Turner Design fluorometer. Water was then collected from this depth with the submersible pump. At all other stations, surface samples were collected with a plastic bucket.

A Guildline Model 87106 CTD as used to measure temperature and salinity to a depth of 200 m.

Size Fractionation

Most samples for light saturation experiments were separated into two or more size fractions. The whole fraction was collected by filtering unscreened water onto Whatman GF/F filters. The >1 µm fraction was collected on 1.0 µm Nuclepore filters using a negative vacuum pressure of 10KPa. The picoplankton fraction (<1 µm size) was that fraction of the whole population that passed through a 1.0 µm

Nuclepore filter at a negative pressure of 10 KPa and was collected on a Whatman GF/F filter.

Primary Productivity

The ^{14}C method described in Strickland and Parsons (1972) was used. Approximately 100 mls of sample water was decanted into 125 ml pyrex glass bottles. For experiments where the whole sample was collected 25 µci sodium bicarbonate ^{14}C was pipetted into each bottle. For all other samples 50 µci was added. For each experiment 40 light and 2 dark bottles were used. The bottles were placed in temperature controlled incubators (Forma Scientific Model 2160 circulating water baths). Illumination was provided by 2000 watt tungsten halogen lamps (New Haline OHS 2000).

All incubations were terminated after four hours and samples filtered immediately. Whole samples were collected directly on Whatman GF/F glass fibre filters. Many experiments were fractioned into >1 µm and <1 µm fractions. This was achieved by serially filtering samples through a 1.0 µm Nuclepore filter and a Whatman GF/F filter. In some experiments, the <1 µm fraction was separated from the whole population prior to incubation. Whole samples were prescreened through a Nuclepore stirred cell fitted with 1.0 µm filters. No suction was used, rather a positive pressure of 50 cm of water.

All samples were sucked dry, exposed to HCl fumes then counted immediately in a liquid scintillation counter.

Organic Particulates

Samples for organic particulates were collected and analysed using the methods described in Irwin et al. (1982). All chlorophylls were analysed on board. The remaining samples were stored at -20°C for later analysis.

DCMU Ratios

The in vivo fluorescence of whole samples and the <1 µm fraction was measured on a Turner Design fluorometer. 0.1 mls of the photosynthetic inhibitor 3-(3,4-dichlorophenyl)-1; 1 dimethylurea (D.C.M.U.) was added to 5 mls of sample and fluorescence measured. The instrument was set at zero using distilled water. The fluorescence blank was 0.2 µm filtered sea water that had been heated to 100°C for 2 minutes. The DCMU ratio

$$\frac{(+\text{DCMU Fluorescence} - \text{Blank}) - (\text{Fluorescence} - \text{Blank})}{(+\text{DCMU Fluorescence} - \text{blank})}$$

was calculated for all samples.

Nutrients

All nutrient samples were stored at -20°C for later analysis using methods described in Irwin et al. (1982).

Photosynthetic Parameters

Measurements of specific production, P^B, and irradiance, I, were used to estimate the parameters in the equation

$$P^B = P_s(1-e^{-\alpha I/P_s})e^{-\beta I/P_s}$$

(Platt et al. 1981) where P_s(mg C (mg Chl a)$^{-1}h^{-1}$) is the light saturated rate of photosynthesis in the absence of photoinhibition, α (mg C (mg Chl)$^{-1}h^{-1}w^{-1}m^{-2}$) is the initial slope of the P-I curve and β (same units as α) is a parameter that characterises photoinhibition. A complete discussion of the fitting routine and its mathematical basis is given in Irwin et al. (1980).

ACKNOWLEDGEMENTS

We wish to thank Dave Rudderham and Mark Hodgson for their assistance in the calculation of the light saturation parameters and analysis of nutrient samples respectively.
